

Question 2/Test Plan

(Index)

My website does work on every browser engine, even the compatibility of different devices or changing my resolution. There was no error in my HTML or CSS but I did have a few spelling errors which I corrected. My graphics and main content was there and my alt attributes. I tested my hyperlinks and they all work. Effects are working just fine. I think my website passes the usability test. The meta tags work as intended. Keywords are being used as designed. I could maybe change some of them that could work better. It only takes 12 mbps to load my page.

(Home)

The home website is compatible with different search engines. The website does change to fit the resolution of the device or the window. The HTML and CSS did pass and both work just fine. I did not have any spelling errors on this page. All graphics and content is there, same with the attributes. The hyperlinks work as well. I don't have any forms for this page but the effects were there. I think the usability/accessibility is good as well. Meta tags and keywords are there and working just fine. It takes 19 mbps to load the page.

(Menu)

The menu page works on other browsers. The website also does change to fit the resolution of the device or the window. The HTML and CSS does work as intended. I did not have any spelling errors on that page. All graphics and content did load and look good. The attributes are there. The hyperlinks work just fine. I don't have any forms for this page but the effects were there. The usability and accessibility I think are fine. Meta tags and keywords are there. It takes 18 mbps to load the site.

(Music)

The Music page works on different browsers. The website does change when loaded on different devices or to fit the window resolution. The HTML and CSS don't have any issues. I did not have any spelling errors on that page. The graphics and content loaded just fine, same with the attributes. The hyperlinks work just fine. I don't have any forms on that page but the effects are fine. The Meta and keywords are there, working just fine. The usability and accessibility I think are just fine for a project. It takes 21 mbps to load the page.

(Jobs)

The Jobs page does work on all browsers. Also the resolution does load differently depending on what device you are trying to access it on. It will also fit the resolution to the window or the device. The HTML and CSS are loading/working just fine. There was only one spelling error which was fixed. The graphics and content didn't have any issues loading or running. Same with the attributes. The meta and keywords were all there and working as intended. The usability and accessibility I think is good. It takes 21 mbps to load the page.

Question 3

What I think I could improve on the page is just making it look more professional. For instance changing the background image to look less outdated. I could also change the colors to feel

more welcoming. I also could add some more text to the website. I also think adding more details or visually appealing edits to the “Jobs” site would make it look better. Like a Fieldset and Legend tag would make it look a lot better. In the end I would want to make it more appealing to look at and a lot more text to look a little more put together or “professional”.

Question 4

For my first scenario I imagine someone going to the music site and wanting to get more information, maybe about who's gonna be the “special guest” for each day for the entire month. They also would maybe want an example of the special guest's talent that would be showing maybe soon to see if they would like to attend the set or not. Or maybe they would just like to follow the special guest on their socials. So what I would improve on the site is adding a link to the special guest's social media pages. I would also add a calendar that has all the people that have reserved a spot to perform their sets. For my second scenario I imagine someone wanting to sign up to perform their act. So what I would also improve is another page with a form to request/sign up to perform. My third scenario is that someone is interested in the origin of the shop. So how I would improve the site is by adding an “about” hyperlink, and in the page it talks about who and when the shop was founded. How I would fully improve the site is by changing the colors, add more pictures, add more information, make the site a lot less bland and blocky.
